

Lin-Hendel et. al. v Saudi Aramco et. al.

DEPT OF THE NAVY
Patent Office

DEC 12 2019

Exhibit 1:

AT 8:29 AM
WILLIAM T. WALSH, CLERK

US Patent 7,308,653 as published by USPTO (25 pages), and first and claims pages of the other 6 patents in this patent family 7,712,044, 8,108,792, 8,850,352, 9,053,205, 9,405,852 and 10,296,198 (19 pages) which share the same specification with 7,308,653.

Priority date of these patents is 1/20/2001.

Application date of the first issued patent is 1/19/2002

Terms extended/adjusted by 615 days.

(57) **ABSTRACT**

An automatic scrolling mechanism that converts the passive browser/web/computer media or any other information repository into an active media that can actively present and “push” information to the users/viewers while retaining the browser/web media’s existing “pull” and interactivity functions. The same mechanism applied in TV/Video Media can give the TV/Video Media interactivity. The automatic scrolling can be controlled by placing a cursor on various control icons, such as a respective end of a floating border structure. The structure may be a box or a line. Furthermore, the structure may be a cluster of arrows, or other symbols. In operation, while the cursor is on the respective end, automatically scrolling occurs to bring forth the content that extends beyond the field of view of the browser display window into view. As the content is scrolled, the content is moved into the field of view of the browser display window in a predetermine direction designated by the respective end. Sub-windows are also designed to be independently and automatically scrolled or floated with respect to the content of the main browser window. Furthermore, this invention automatically activates links created in an information repository, actively retrieves the linked information, and automatically present and scroll the retrieved information to the users/viewers of the repository. As the content is automatically scrolled, the repository is pushed to the user and allured to further navigate there through the repository.

**AUTOMATED SCROLLING OF BROWSER
CONTENT AND AUTOMATED ACTIVATION
OF BROWSER LINKS****CROSS REFERENCE TO RELATED
APPLICATIONS**

This application claims priority from the U.S. Provisional Patent Application Ser. No. 60/262,998 filed on Jan. 20, 2001.

FIELD OF THE INVENTION

This invention relates to automatically scrolling parts of, or the entire content information displayed in a browser page. The invention also relates to partitioned display windows within browsers, and more particularly to display windows that include a plurality of structures that can effectuate scrolling through the content or pages of a browser wherein such content or pages extend beyond the limits of a display window.

The invention also relates to preprogramming automated activation of links contained in browser pages, and automated scrolled presentation of the linked information.

BACKGROUND OF THE INVENTION

The two major classes of electronic media formats that present information to viewer of the information are: (1) the television/video format, and (2) the browser/web format. The television/video format actively presents/pushes continually changing information to passive viewers. The browser/web/computer format is passive, requiring a viewer to "pull" information from the storage devices of that media by entering input requests/commands through an input device. In other words, the viewer is required to actively navigate the browser/web/computer format to receive information.

While the television/video format is convenient, requiring no viewer effort, it lacks interactivity. The browser/web/computer format, on the other hand, sits still, is static until a viewer makes an input/request through an input device to request or navigate to certain information. As can be seen, the browser/web/computer format allows for one input/request at a time for one piece of particular information, a procedure that is tedious and tiring.

Referring now to FIG. 1, for browser/web pages 10 wider or longer than display window 12, conventional browsers 14 include vertical scroll arrows 16a and 16b in combination with a vertical scroll bar 16 at the right edge of the browser 14 to move the content up-and-down within the display window 12. Furthermore, horizontal scroll arrows 18a and 18b in combination with a horizontal scroll bar 18 are provided at the bottom edge of the browser 14 to move the content left-and-right within the display window 12.

In operation, the user of a computer may scroll through the content by moving the cursor 20 to one of the scroll bars 16 or 18, pressing down the left key of a mouse and dragging the scroll bar, up, down, left or right, via the mouse. When using the scroll bars 16 or 18, the entire content (top to bottom) is scrolled substantially within the designated dragging area of the display window. Hence, when dragging the scroll bar 16 or 18, a user can gradually, or quickly at the speed of the fingers' dragging motion permits, move to the end of the content by dragging the scroll bar 16 or 18 to a desired point, or to the end of such designated dragging area.

2

Alternately, the user could scroll in incremental steps or distances up, down, left or right within the content by repeatedly click the left key of the mouse on any one of the scroll arrows 16a, 16b, 18a and 18b. As can be appreciated, these approaches are tedious and finger tiring. Moreover, this approach is even more tiresome when using a mouse-pad to operate the scroll arrows 16a, 16b, 18a and 18b and scroll bars 16 and 18.

In order to access and view additional information linked to a particular browser/web/computer-display page through the "links" contained in the page, the viewer must move the cursor to a particular link (for example, by holding down the left button of a computer "mouse" input device and sliding the "mouse" on a "mouse pad"), and "click" (the mouse left button) or push a button of an input device to request that particular information to be displayed on the display screen. Such operation must be performed one-link at a time, while requiring the viewer to know exactly which "link" to "click" for what information, or to explore, experiment, and guess.

SUMMARY OF THE INVENTION

The present invention contemplates a method of displaying and navigating through repositories of information via a browser by automatically scrolling the content/pages of an information media without requiring user/viewer input. Thus, the repository of information is actively "pushed" to the user, while also allow user to interact with the information and the media. The method automates sequences of blinking links and activates links that contain essential and/or important information to particular sets of viewers/users; and automatically and sequentially presents/pushes such information to particular sets of viewers/users. The same technique can be used to "partition" a TV/video screen and make the TV/video screen "interactive." For example, a model is wearing a particularly stunning dress, you can click on the female figure, and the information, and the purchasing link appears on a separate sub-window. Similarly, if you like the "car" James Bond is driving, or the suit he is wearing, you can do the same.

The present invention also contemplates at least one sub-window inside a browser's main-window that can be independently and automatically or manually scrolled to display content of that sub-window extending beyond the viewing field of that sub-window. Or, the sub-window can remain floating in-place on the computer/browser display screen, while the main page(s) of the browserwindow is automatically or manually scrolled to bring into view the page content that extends beyond the limits of the main browser window.

Furthermore, the present invention contemplates a method of controlling the automatic scrolling within a window or sub-window of a browser/web media page.

BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 illustrates a conventional browser in combination with a page presented by the conventional browser.

FIG. 2 illustrates the browser, in accordance with the present invention, in combination with a page, containing the floating boarder structure that facilitates user control of the automated scrolling.

FIG. 3 illustrates an alternate embodiment of the browser, in accordance with the present invention, in combination with a page.

FIGS. 4A-4G illustrate examples of the separately controllable autoscrolling features in between the main page and sub-windows.

US 7,308,653 B2

3

FIGS. 5A-5G illustrate an application of this invention in a Tutorials/Guide environment, where instructions for the user's action is contained in a floating box that remains within viewing field, while the changing content of the Tutorial/Guide is automatically activated and scrolled through the browser window's viewing field.

DETAILED DESCRIPTION OF THE INVENTION

Referring now to FIG. 2, the present invention can be added as additional tool, or substitutes for the vertical scroll arrows 16a and 16b in combination with the vertical scroll bar 16 and the horizontal scroll arrows 18a and 18b in combination with the horizontal scroll bar 18 with a first boarder floating structure 30 on the right edge, a second boarder floating structure 32 on left edge, a third boarder floating structure 34 on the top edge and a fourth boarder floating structure 36 on the bottom edge of the display window 40.

In the exemplary embodiment, the first, second, third and fourth boarder floating structures 30, 32, 34 and 36 are floating lines or boxes or other geometric shapes that have designated ends for designating a predetermine scrolling direction. The floating line or floating box is considered floating since it always stays in essentially the same position as the content moves within the field of view. The first, second, third and fourth boarder floating structures 30, 32, 34 and 36 are the user's control vehicle or mechanism for activating and controlling the automatic scrolling function.

In operation, when the cursor 42 is moved onto either of the top end T1, T2 of one of the first and second boarder floating structures 30 and 32, the page is automatically scrolled up (or down) to bring within the field of view the content of the page that extends beyond the bottom (or top) edge of the display window 40. Alternately, when the cursor 42 is moved onto either of the bottom end B1, B2 of one of the first and second boarder floating structures 30 and 32, the page is automatically scrolled down (or up) to bring within the field of view the content of the page that extends above (or below) the bottom edge of the display window 40.

In an alternate embodiment, only one of these paired structures 30 and 32 are needed. Having both structures 30 and 32 brings added convenience to the user/viewer to choose for using the structure that is closer to the present cursor position.

Furthermore, placing the cursor 42 on either of the right-side end R1, R2 of one of the third and fourth boarder floating structures 34 and 36, would automatically scroll the page to the right (or left) to bring within the field of view the content previously beyond the left (or right) edge of the display window 40. Placing the cursor 42 on either of the left-side end L1, L2 of one of the third and fourth boarder floating structures 34 and 36, would automatically scroll the page to the left (or right) to bring within the field of view the content previously beyond the right (or left) edge of the display window 40.

Alternately or in-addition, the GO/STOP/PAGE/CONTINUOUS and SLOW DOWN and SPEED UP functions can be implemented with any desired/appropriate symbols or conventions. In the exemplary embodiment, a floating scrolling tool 49 is provided. The floating scrolling tool 49 includes a go button 43, stop button 44, page button 45, slower button 47 and faster button 48. The floating scrolling tool 49 is a user control tool implemented as an embodiment of this invention. It remains in view while the page content is scrolled through the viewing field.

4

The operation of the floating scrolling tool 49 will now be described. The go button 43 when clicked begins the automatic scrolling. The stop button 44 when clicked stops the automatic scrolling. The page button 45 when clicked advances the window to display the next full-page that is currently just out of the field of view. The continuous button 46 when clicked resumes the automatic scrolling from the current position. The go button 43 serves the same function, thus button 46 can be eliminated. Since people normally read in one direction, downward; and when there was no content beyond the left and right edges of the field of view, directionality need not be shown. However, if the page requires right and left directionality, directional buttons may be substituted for the single go button 43. Finally, the slower button 47 decreases the scrolling speed while the faster button 48 increases the scrolling speed.

The automatic scrolling is automatically stopped when the cursor 42 is moved away from the top ends T1, T2, bottom ends B1, B2, left-side ends L1, L2, and right-side ends L1, L2. Moreover, the automatic scrolling is automatically paused at every full-screen or full-window shift. When the scrolling is paused at a full-screen or full-window shift, the automatic scrolling can be resumed in the direction of the previous scrolling by clicking the left key of a mouse while the cursor 42 is still on a respective one of the ends.

Accordingly the automatic scrolling is essentially continuous within a full-screen or full-window shift, unless stopped by moving the cursor 42. Furthermore, scrolling can be programmed to automatically stops at the end of the content or page, to be resumed by clicking on a respective end for looping or reversing, or clicking on the go button 43 or continue button 46. It can also be programmed to loop after pausing, until the user clicks on a link to go else where in the information repository, or an automated link-activation sequence brings new pages to the browser

The speed of the scrolling can also be controlled using an input device or mouse. For example, "clicking" the left button of the "mouse" (input device) while the cursor 42 is at an end would increase the speed of the automatic scrolling in the direction designated by the end. Moving the cursor 42 away from the top, bottom, left or right ends along and on a respective structure 30, 32, 34 or 36 would decrease the scrolling speed.

Referring now to FIG. 3, the user-control vehicle of the automatic scrolling of the present invention can also be implemented with a cluster of arrows 50 at one location. The cluster of arrows 50 includes an up arrow 52, a down arrow 54, a left arrow 56 and a right arrow 58. By placing the cursor 42 on a respective arrow, the content would shift at the direction of such arrow.

As can be appreciated, the present invention provides for automated scrolling within a display window 40 without the continual strain and motion of the fingers and hand that is required using the conventional "scroll bars" in browsers.

Referring now to FIGS. 4A-4G, examples of the auto-scrolling features of the present invention with multiple windows are illustrated. FIGS. 4A and 4B illustrate a main page 60 having a plurality of navigation links 62 at the top of the main page 60, to the left of the Christmas tree, and within the graphics. The navigation links 62 provide for navigation such as via HTML links within a website. The main page 60 includes sub-window partitions that form a pair of columns 70 and 72 that cover part of the field of view of the main page 60. Additionally, the main theme of the content 60a is provided to the left of the pair of columns 70 and 72.

US 7,308,653 B2

5

For exemplary purposes, the pair of columns **70** and **72** is depicted as advertisement display sub-windows. Nevertheless, the main page **60** may have any number of sub-window partitions that may be vertically or horizontally oriented, or cut into random areas of the main content. The right column **72** of the advertising display and the main content area **60a** are stationary while the left column **70** is automatically scrolling.

As can be appreciated, the present invention can be used to automatically scroll partitioned information apart from a browser/web, or TV/Video's main content, such as financial market news and summaries, weather reporting, special features, sports news, movie previews, special stories, or advertisements.

Referring now to FIGS. **4A** and **4C**, the main page **60a** and the right column **72** are automatically scrolled in synchronization with **60a**, or can be manually scrolled using the conventional browser scroll bar **16** or the vertical scroll arrows **16a** and **16b** along with **60a**. The left column **70** continues to automatically scroll independently of the main page **60a** and the right column **72**.

FIGS. **4D** and **4E** illustrates the left column **70** is automatically scrolling independently. The right column **72** is floating independently inview, while—the X-tree may be auto scrolled or manually scrolled independent of column **70** and **72**.

Referring now to FIGS. **4D** and **4E**, the main page **60a** and the left column **70** may be each independently automatically scrolled at different speeds. For example, the main page **60** is automatically scrolled at a first speed while the left column **70** is scrolled at a second speed higher than the first speed. The right column **72** remains stationary or floating in view.

It should be noted, the scrolling within the main page **60**, **60a**, left column **70** and/or the right column **72** can be effectuated using the first, second, third and fourth boarder floating structures **30**, **32**, **34** and **36** described in detail above. Additionally or alternatively the floating scrolling tool **49** may be provided. The columns **70** and **72** are for advertisement in the exemplary embodiment, such columns do not generally require scrolling control. However, for sub-windows that display weather reports, stock quotes, feature stories, etc., the floating scrolling tool **49** may be incorporated.

The pair of columns (sub-windows) **70** and **72** do not need to be separated in columns from the remainder of the browser main page **60**. They can be cut-ins within the main page **60** as shown in FIG. **2**, or overlap the main page, as shown in FIGS. **5A**, **5B**, **5C**, **5D**, **5E**, **5F**.

Referring now to FIGS. **5A-5F**, the present invention is applied to creating a Tutorial/Guide to a new dynamic push/pull, active/interactive website. FIGS. **5A**, **5B**, **5C**, **5D**, **5E**, and **5F** illustrate that instructions for users/viewers are contained in a floating instruction box **110** overlapping the field of view of the browser's main window **90**. The content of the main pages are automatically and continually scrolled through the field of view of the browser window **90**. The present invention uses sequences of preprogrammed, automatic activation of links to automatically retrieve the additional linked information, and scroll, present, and “push” such automatically retrieved information continually to the user/viewer as shown in FIGS. **5C**, **5D**, **5E**. The “link” (HTML, XML, DTML, etc.) that is to be automatically activated would “blink” (highlighted or emphasized in a manner to call attention directly thereto) before activation.

6

All links contained in the scrolled pages, as well as in the floating “instruction box” are functional, ready to receive user/viewer action/input or selection.

FIGS. **5A**, **5B**, **5C**, **5D**, **5E** and **5F** illustrate an application of the presents invention in a Tutorials/Guide environment, where instructions for the user's action relevant to the displayed information/page is contained in a floating instruction box **110** while the content of the Tutorial/Guide (as conveyed by the illustrations and text content) is automatically scrolled through the browser window **100**. Any sequence of links (HTML, XML links, DTML links, or other links that can be clicked to navigate to a different page) are pre-programmed to be automatically invoked or activated to retrieve (navigate to) the linked information, to scroll, present, and “push” to the user, even if the user does nothing. All links contained in the scrolled pages, as well as, in the floating instruction box **110** are functional to receive the user's input or selection.

In the preferred embodiment, links in the pages are preprogrammed to flash and are activated automatically. When activated, the link's resulting information is displayed (navigated to), automatically scrolled and pushed to the viewer. In the exemplary embodiment, the graphical images of the cruise ship **114**, vehicle **116**, watches **118**, a dressed women **120**, etc. are links. Everything displayed can be a link including: the airplane **124**, the man **126**, the wine **128**, the table **130**, the picture **132**, the furniture **134**, even the background is a link to something. All of these links are active and functional while scrolled, and all and any of these links can be pre-programmed into automated activation sequences. Moreover, most text phrases or words are navigational links, such as word phrases **122**.

When a cursor is placed on a link—whether it is an image, a part of an image, or text, there is a small dialog box (NOT SHOWN) that shows up to describe the link. In the exemplary illustrations, the link flashed and automatically activated is the dressed woman **120** in a rather formal but slick business dress in **5A** and **5B**, that results in the appearance/display and scrolling of FIGS. **5C**, **5D**, and **5E**.

Additionally, the floating instruction box **110** includes a graphical icon **120a** of that same picture of the dressed woman **120**, instructing or alluring the user to move the cursor onto the graphical women icon **120a** and click. The automated feature of the link navigates the user to the women's business formal section.

The floating instruction box **110** contains instructions regarding what to do, and contains active links **132**, **134**, **136** and **138** to navigate to additional information. The help button **140** provides access to additional instructions. The feedback button allows the user to provide feedback. The “floating” feature of the floating instruction box **110** allows such box to be within view so that it can be accessed anytime as the main pages **100** are scrolled. It can also be “double clicked” out of view, or “double clicked” back into view, or controlled by any desirable control symbol or convention, such as the standard “” window-minimizing icon in Microsoft applications. As the user interacts with the instructions in the floating instruction box **110**, a new page is displayed (navigated to) and new instructions relevant to such new page appear in the floating instruction box **110**, so that the user does not have to go else where to look for help/guide/instruction material.

All of the educational or help/guide/instructional material has instructions at a certain place on a page, or even previous pages. Therefore, when the user wants to look at it again, the user can scroll or page back to where the instruction was—if it is remembered where it was seen, and lose the place where

US 7,308,653 B2

7

you are actually working on, and needing those damned (are you sure you want to use this word here?) instructions that was way back where you don't remember.

The floating instructional box 110 further includes <P Pages N> for moving to previous or next pages when the <P or N> is clicked.

In the exemplary embodiment, if the user clicked on the graphical women icon 120a, FIGS. 5C, 5D and 5E may commence. The women icon 120a in the floating instructional box 110 is just a replicate of the women 120 in the page 100—representing women's business clothes. However, if the women 120 was dressed in ball gowns, prom or formal wear, it would be associated with the navigational link associated therewith. The "Steps" in the Categories section of the floating instruction box 110 allows the user to navigate to any sub category desired.

It should be noted the primary difference in FIGS. 5A and 5B is that the main page 100 is scrolling.

Referring now to FIGS. 5C, 5D and 5E, these figures represent the pages or part of pages 150a, 150b, 150c for navigating through the women's business apparel. The primary difference in these figures is that the pages are automatically scrolling thus the women's business apparel is "pushed" and presented to the user. The floating instruction box 110' remains essentially stationary. The user can select various elements in the displayed selection array to see additional information, or to buy something. The illustrations of FIGS. 5C, 5D and 5E illustrates that the website pages actively "push" the content to the viewer. In other words, the website actively navigates for the user and does not sit still waiting for the user's input before any navigation commences.

FIG. 5F illustrates the floating instruction box 110' when the help button 140 is clicked. The floating instruction box 110' includes a drop down dialog box 160 to explain the arrangement of the page.

FIGS. 5A-5F include a sub-window 170 that can be continuously scrolled automatically independently of the main window of the pages 100, 150a, 150b and 150c.

The present invention also provides a mechanism to make the otherwise passive browser/web media active and interactive, and TV/Video media interactive, enabling both media with pushing and pulling functions.

As can be appreciated, the present invention provides a method of automatically displaying and navigating through a media, whether TV/Video or Computer/Browser; and, automatically scrolling the content to push and allure navigation through the media.

The website exemplified in FIGS. 5A through 5F has multiple categories wherein each category has multiple sub-categories. The method provides for displaying a floating dynamic instruction box 110, 110' overlaid on the page that displays navigational links for alluring the user to further navigate to a category or to a sub-category.

The page 100 is a website home page. The page 100 includes at least one blinking picture or link. The method dynamically changes the floating dynamic instruction box 110, 110' in response to the at least one blinking picture to entice the user to further navigate.

Accordingly, the method automates sequences of blinking links in a page; and activates the blinking links of the sequences to automatically and sequentially push navigation within the website. The sequences may be programmed based on a user's demographics or profile, or any other suitable criteria.

8

The pages 100, 150a, 150b and 150c include a sub-window 170. The subwindow 170 can be automatically scrolled independently of the main window of pages 100, 150a, 150b and 150c.

Numerous modifications to and alternative embodiments of the present invention will be apparent to those skilled in the art in view of the foregoing description. Accordingly, this description is to be construed as illustrative only and is for the purpose of teaching those skilled in the art the best mode of carrying out the invention. Details of the structure may be varied substantially without departing from the spirit of the invention and the exclusive use of all modifications, which come within the scope of the appended claims, is reserved.

What is claimed is:

1. A method of automatically scrolling comprising the steps of:

- (a) placing a cursor on a respective end of a floating border structure;
- (b) in direct response to step (a), automatically scrolling through content extending beyond a display window into a field of view of the display window in a predetermined direction designated by the end, wherein the step of automatically scrolling continues to be performed without user input;
- (c) during the step (b), determining if a full-screen shift of the content has occurred;
- (d) in response to the step (c) automatically Pausing the step (b);
- (e) after the step (d), clicking a left key of a mouse; and
- (f) in response to the step (e), resuming the step (b).

2. The method according to claim 1, wherein: the floating border structure has a top end and a bottom end; and

the step (b) includes:

when the respective end is the top end, the content is automatically scrolled down to bring the content within the field of view; and,

when the respective end is the bottom end, the content is automatically scrolled up to bring the content within the field of view.

3. The method according to claim 2, wherein the floating border structure has a right-side end and a left-side end; and wherein the step (b) further includes the steps of:

when the respective end is the right-side end, the content is automatically scrolled left to bring the content within the field of view; and

when the respective end is the left-side end, the content is automatically scrolled right to bring the content within the field of view.

4. The method according to claim 1, comprising the steps of:

- (g) moving the cursor away from the respective end; and
- (h) directly in response to the step (g), automatically stopping the step (b).

5. The method according to claim 1, wherein the display window is a browser window, and the content is a page.

6. The method according to claim 1, wherein the floating border structure is a floating line or floating box.

7. The method according to claim 1, further comprising the steps of activating a user control to perform one of: begin automatic scrolling, stop automatic scrolling, advance scrolling a page, increase scrolling speed and decrease scrolling speed.

8. A computer configured to display a browser display window having a field of view, the browser display window comprising:

US 7,308,653 B2

9

a first floating border structure having first and second ends oriented in a vertical plane for effectuating automatic scrolling vertically through content within the field of view in direct response to a cursor being placed on a respective one of the first and second ends, wherein automatically scrolling vertically is effectuated continuously without user input; and
 a second floating border structure having third and fourth ends oriented in a horizontal plane for effectuating automatic scrolling horizontally through content within the field of view in direct response to the cursor being placed on a respective one of the third and fourth ends, wherein automatically scrolling horizontally is effectuated continuously without user input;
 wherein the content is a page, wherein the page comprises at least one link to additional linked information, and wherein the computer is further configured to automatically retrieve and display the additional linked information when the user does nothing.

9. The computer according to claim 8, wherein, the first floating border structure has a top end and a bottom end such that when the respective end is the top end, the content is automatically scrolled down to bring the content within the field of view, and when the respective end is the bottom end, the content is automatically scrolled up to bring the content within the field of view.

10. The computer according to claim 9, wherein:
 the second floating border structure has a right-side end and a left-side end;
 when the respective end is the right-side end, the content is automatically scrolled left to bring the content within the field of view; and
 when the respective end is the left-side end, the content is automatically scrolled right to bring the content within the field of view.

11. The computer according to claim 8, wherein each floating border structure of the first and second floating border structures is a floating line.

12. The computer according to claim 8, wherein each floating border structure of the first and second floating border structures is a floating box.

13. The computer according to claim 8, wherein the automatic scrolling is limited to a full-screen shift.

14. The computer according to claim 8, wherein the automatic scrolling is automatically stopped when the cursor is moved away from the first floating border structure or the second floating border structure.

15. The computer according to claim 8, wherein the browser display window is a main display window, the computer being further configured to display a second display window having a second field of view within the main display window, the second display window comprising:

a first floating sub-border structure having first and second ends of the first floating sub-border structure oriented in a vertical plane for effectuating automatic scrolling vertically through content within the second field of view in direct response to the cursor being placed on a respective one of the first and second ends of the first floating sub-border structure; and

a second floating sub-border structure having third and fourth ends of the second floating sub-border structure oriented in a horizontal plane for effectuating automatic scrolling horizontally through content within the second field of view in direct response to the cursor being placed on a respective one of the third and fourth ends of the second floating sub-border structure.

10

16. A computer configured to display a browser display window having a field of view, the browser display window comprising:

a first floating border structure having first and second ends oriented in a vertical plane for effectuating automatic scrolling vertically through content within the field of view in direct response to a cursor being placed on a respective one of the first and second ends, wherein automatically scrolling vertically is effectuated continuously without user input; and

a second floating border structure having third and fourth ends oriented in a horizontal plane for effectuating automatic scrolling horizontally through content within the field of view in direct response to the cursor being placed on a respective one of the third and fourth ends, wherein automatically scrolling horizontally is effectuated continuously without user input;

wherein the browser display window further comprises a plurality of autoscrolling controls, the plurality of auto-scrolling controls including:

a go button for beginning automatic scrolling and resuming automatic scrolling from current position when the go button is clicked;

a stop button for stopping automatic scrolling when the stop button is clicked;

a page button for advancing the window to display next full-page that is out of the field of view when the page button is clicked;

a slow down button for decreasing automatic scrolling speed when the slow down button is clicked; and, a speedup button for increasing automatic scrolling speed when the speedup button is clicked.

17. A method of displaying and navigating through a website wherein the website has multiple categories wherein each category has multiple sub-categories, comprising the steps of:

displaying on a display of a computer a page of the website;

during the displaying step, automatically scrolling the page while the user of the computer does nothing;

displaying a floating dynamic instruction box overlaid on the page that displays navigational links for alluring the user to further navigate to a category or to a sub-category, the floating dynamic instruction box remaining stationary on the display.

18. The method according to claim 17, wherein the page is a website home page.

19. The method according to claim 17, wherein the page includes at least one blinking picture or link; and further comprising the step of:

dynamically changing the floating dynamic instruction box in response to the at least one blinking picture to entice the user to further navigate.

20. The method according to claim 17, wherein the page includes at least two independent windows.

21. The method according to claim 20, further comprising the step of automatically scrolling independently the at least two independent windows.

22. The method according to claim 20, further comprising the steps of:

automatically scrolling a first one of the at least two independent windows at a first speed; and,

automatically scrolling a second one of the at least two independent windows at a second speed different from the first speed.

US 7,308,653 B2

11

23. The method according to claim 20, further comprising the steps of:
manually scrolling a first one of the at least two independent windows; and,
continuously, automatically scrolling a second one of the 5
at least two independent windows.
24. A method of displaying and navigating through a website comprising the steps of:
displaying on a display of a computer a page of the website;
during the displaying step, automatically scrolling the page while the user of the computer does nothing;
automating sequences of blinking links in the page; and,
activating the blinking links of the sequences to automatically 10
and sequentially retrieve additional information linked by the blinking links and present the additional information on the display, thereby pushing navigation within the website.
25. The method according to claim 24, wherein the sequences are based on user demographics or profile.
26. An apparatus for displaying and navigating through a website, the apparatus comprising a computer configured to perform steps comprising:
displaying on a computer display a browser window having a field of view for displaying a webpage of the website within the field of view; and
automatically scrolling the webpage in response to placement of a cursor on a floating structure displayed on the display to push and allure navigation through the website, wherein the step of automatically scrolling 15
continues to be performed when the user of the computer does nothing;
wherein the website has multiple categories wherein each category has multiple sub-categories, the computer being further configured to display a floating dynamic instruction box overlaid on the webpage, the floating dynamic instruction box displaying navigational links for alluring the user to further navigate to a category to 20
- 30
- 35

12

- a sub-category, the floating dynamic instruction box remaining stationary on the display.
27. The apparatus according to claim 26, wherein the webpage is a website home page.
28. The apparatus according to claim 26, wherein:
the webpage includes at least one blinking picture or link; the computer is further configured to implement means for dynamically changing the floating dynamic instruction box in response to the at least one blinking picture or link to entice the user to further navigate.
29. The apparatus according to claim 26, further comprising:
means for automating sequences of blinking links in the webpage; and
means for activating the blinking links of the sequences to automatically and sequentially retrieve additional information linked by the blinking links and present the additional information on the display, thereby pushing navigation within the website.
30. The apparatus according to claim 26, wherein the webpage includes at least two independent windows.
31. The apparatus according to claim 30, wherein the at least two independent windows are automatically scrolled independently.
32. The apparatus according to claim 30, wherein:
a first one of the at least two independent windows is automatically scrolled at a first speed; and
a second one of the at least two independent windows is automatically scrolled at a second speed different from the first speed.
33. The apparatus according to claim 30, further comprising:
means for manually scrolling a first one of the at least two independent windows; and
means for continuously, automatically scrolling a second one of the at least two independent windows.

(57) ABSTRACT

An automatic scrolling mechanism converts an information repository into media that can actively present and "push" information to the users/viewers while retaining existing "pull" and interactivity functions. Automatic scrolling can be controlled by placing a cursor on control icons, such as boxes, lines, and arrow clusters. While the cursor is on an icon, automatic scrolling brings into view content that extends beyond the field of view. The scrolled content is moved into the field of view of the display window in a predetermined direction designated by the icon. Sub-windows are also designed to be independently and automatically scrolled or floated with respect the main window. Links created in an information repository may be automatically activated to retrieve the linked information, and to automatically present and scroll the information. As the content is automatically scrolled, the repository is pushed and the user is allured to further navigate through the repository.

25 Claims, 17 Drawing Sheets

US 7,712,044 B2

7

ciated therewith. The "Steps" in the Categories section of the floating instruction box 110 allows the user to navigate to any sub category desired.

It should be noted the primary difference in FIGS. 5A and 5B is that the main page 100 is scrolling.

Referring now to FIGS. 5C, 5D and 5E, these figures represent the pages or part of pages 150a, 150b, 150c for navigating through the women's business apparel. The primary difference in these figures is that the pages are automatically scrolling thus the women's business apparel is "pushed" and presented to the user. The floating instruction box 110' remains essentially stationary. The user can select various elements in the displayed selection array to see additional information, or to buy something. The illustrations of FIGS. 5C, 5D and 5E illustrates that the website pages actively "push" the content to the viewer. In other words, the website actively navigates for the user and does not sit still waiting for the user's input before any navigation commences.

FIG. 5F illustrates the floating instruction box 110' when the help button 140 is clicked. The floating instruction box 110' includes a drop down dialog box 160 to explain the arrangement of the page.

FIGS. 5A-5F include a sub-window 170 that can be continuously scrolled automatically independently of the main window of the pages 100, 150a, 150b and 150c.

The present invention also provides a mechanism to make the otherwise passive browser/web media active and interactive, and TV/Video media interactive, enabling both media with pushing and pulling functions.

As can be appreciated, the present invention provides a method of automatically displaying and navigating through a media, whether TV/Video or Computer/Browser; and, automatically scrolling the content to push and allure navigation through the media.

The website exemplified in FIGS. 5A through 5F has multiple categories wherein each category has multiple sub-categories. The method provides for displaying a floating dynamic instruction box 110, 110' overlaid on the page that displays navigational links for alluring the user to further navigate to a category or to a sub-category.

The page 100 is a website home page. The page 100 includes at least one blinking picture or link. The method dynamically changes the floating dynamic instruction box 110, 110' in response to at least one blinking picture to entice the user to further navigate.

Accordingly, the method automates sequences of blinking links in a page; and activates the blinking links of the sequences to automatically and sequentially push navigation within the website. The sequences may be programmed based on a user's demographics or profile, or any other suitable criteria.

The pages 100, 150a, 150b and 150c include a sub-window 170. The subwindow 170 can be automatically scrolled independently of the main window of pages 100, 150a, 150b and 150c.

Numerous modifications to and alternative embodiments of the present invention will be apparent to those skilled in the art in view of the foregoing description. Accordingly, this description is to be construed as illustrative only and is for the purpose of teaching those skilled in the art the best mode of carrying out the invention. Details of the structure may be varied substantially without departing from the spirit of the invention and the exclusive use of all modifications, which come within the scope of the appended claims, is reserved.

What is claimed is:

1. A method of automatically scrolling displayed content, comprising:

in an electronic device with a display and a user input mechanism;

displaying content in a display window;

displaying a floating icon; and

in response to placement by a user of a cursor on the floating icon, and

without any further user action, automatically scrolling through content extending beyond a display window into a field of view of the display window in a predetermined direction designated by the floating icon, wherein the automatic scrolling continues without user input.

2. The method according to claim 1, wherein:

the floating icon has a top end and a bottom end; and the automatic scrolling further includes:

when the cursor is placed on the top end, automatically scrolling the content down to bring the content within the field of view; and

when the cursor is placed on the bottom end, automatically scrolling the content up to bring the content within the field of view.

3. The method according to claim 1, wherein:

the floating icon has a right-side end and a left side end; and the automatic scrolling further includes:

when the cursor is placed on the right-side, automatically scrolling the content left to bring the content within the field of view; and

when the cursor is placed on the left-side end, automatically scrolling the content right to bring the content within the field of view.

4. The method according to claim 1, further comprising: in response to movement by the user of the cursor away from the floating icon.

5. The method according to claim 1, further comprising: during the automatic scrolling, determining that a full-screen shift of the content has occurred; and

in response to the determining automatically pausing the automatic scrolling.

6. The method according to claim 1, wherein the display window is a browser window, and the content is a page.

7. The method according to claim 1, further comprising: activating a user control to perform at least one of: begin automatic scrolling, stop automatic scrolling, advance scrolling a page, increase scrolling speed, and decrease scrolling speed.

8. A method of automatically scrolling displayed content comprising:

in an electronic device with a display and a user input mechanism;

displaying content in a display window;

displaying a plurality of direction indicators; and

in response to placement by a user of a cursor on at least one direction indicator of the plurality of direction indicators, and

without any further user action, automatically scrolling through content extending beyond a display window into a field of view of the display window in a predetermined direction designated by the at least one direction indicator, wherein the automatic scrolling continues without user input.

9. An electronic device with a display having a graphical user interface, comprising:

a browser display window having a field of view;

a user input mechanism; and

8

US 7,712,044 B2

9

a floating icon for effectuating automatic scrolling through content in response to a cursor being placed on the floating icon, wherein the automatic scrolling continues without user input.

10. The electronic device according to claim 9, wherein: the floating icon has a top end and a bottom end; and the automatic scrolling further includes:

when the cursor is placed on the top end, automatically scrolling the content down to bring the content within the field of view; and

when the cursor is placed on the bottom end, automatically scrolling the content up to bring the content within the field of view.

11. The electronic device according to claim 9, wherein: the floating icon has a right-side end and a left side end; and the automatic scrolling further includes:

when the cursor is placed on the right-side end, automatically scrolling the content left to bring the content within the field of view; and

when the cursor is placed on the left-side end, is automatically scrolling the content right to bring the content within the field of view.

12. The electronic device according to claim 9, further comprising:

during the automatic scrolling, determining that a full-screen shift of the content has occurred; and

in response to the determining automatically stopping the automatic scrolling.

13. The electronic device according to claim 9, further comprising:

in response to movement by the user of the cursor away from the floating icon, automatically stopping the automatic scrolling.

14. The electronic device according to claim 9, wherein the browser display window is a main display window, the electronic device being further configured to display a second display window having a second field of view within the main display window, the second display window comprising:

a first floating icon having first and second ends of the first floating icon oriented in a vertical plane for effectuating automatic scrolling vertically through content within the second field of view in direct response to the cursor being placed on a respective one of the first and second ends of the first floating icon; and

a second floating icon having third and fourth ends of the second floating icon oriented in a horizontal plane for effectuating automatic scrolling horizontally through content within the second field of view in direct response to the cursor being placed on a respective one of the third and fourth ends of the second floating icon.

15. A method of displaying and navigating through a website comprising:

displaying on a display of a computer a page of the website; and

10

during the displaying operation and without any user-initiated actions, automatically scrolling at least part of the page while the user of the computer does nothing.

16. The method according to claim 15, wherein the page includes at least two independent windows.

17. The method according to claim 16, further comprising: automatically scrolling at least part of the at least two independent windows, wherein the at least two independent windows are independently scrolled.

18. The method according to claim 16, further comprising: automatically scrolling at least part of a first independent window of the at least two independent windows at a first speed; and

automatically scrolling at least part of a second independent window of the at least two independent windows at a second speed, wherein the second speed is different from the first speed.

19. The method according to claim 16, further comprising: in response to manual inputs by a user, scrolling at least part of a first independent window of the at least two independent windows; and

automatically scrolling at least part of a second independent window of the at least two independent windows.

20. The method of claim 15, further comprising: stopping the automatic scrolling in response to a user input.

21. An apparatus for displaying and navigating through a website, the apparatus comprising a computer configured to perform the following:

displaying in a computer display a browser window having a field of view for displaying a webpage of the website within the field of view; and

during the displaying operation and without any user-initiated actions, automatically scrolling at least part of the webpage while the user of the computer does nothing.

22. The apparatus according to claim 21, wherein the webpage includes at least two independent windows.

23. The apparatus according to claim 22, further comprising: automatically scrolling at least part of the at least two independent windows, wherein the at least two independent windows are independently scrolled.

24. The apparatus according to claim 22, wherein a first independent window of the at least two independent windows is automatically scrolled at a first speed; and a second independent window of the at least two independent windows is automatically scrolled at a second speed, wherein the second speed is different from the first speed.

25. The apparatus according to claim 22, further comprising:

means for receiving manual inputs from a user and scrolling at least part of a first independent window of the at least two independent windows; and

means for automatically scrolling at least part of a second independent window of the at least two independent windows.

(57) **ABSTRACT**

An automatic scrolling mechanism converts an information repository into media that can actively present and "push" information to the users/viewers while retaining existing "pull" and interactivity functions. Automatic scrolling can be controlled by placing a cursor on control icons, such as boxes, lines, and arrow clusters. While the cursor is on an icon, automatic scrolling brings into view content that extends beyond the field of view. The scrolled content is moved into the field of view of the display window in a predetermined direction designated by the icon. Sub-windows are also designed to be independently and automatically scrolled or floated with respect the main window. Links created in an information repository may be automatically activated to retrieve the linked information, and to automatically present and scroll the information. As the content is automatically scrolled, the repository is pushed and the user is allured to further navigate through the repository.

20 Claims, 17 Drawing Sheets

US 8,108,792 B2

7

The floating instructional box 110 further includes <P Pages N> for moving to previous or next pages when the <P or N> is clicked.

In the exemplary embodiment, if the user clicked on the graphical women icon 120a, FIGS. 5C, 5D and 5E may commence. The women icon 120a in the floating instructional box 110 is just a replicate of the women 120 in the page 100—representing women's business clothes. However, if the women 120 were dressed in ball gowns, prom or formal wear, it would be associated with the navigational link associated therewith. The "Steps" in the Categories section of the floating instruction box 10 allows the user to navigate to any sub category desired.

It should be noted the primary difference in FIGS. 5A and 5B is that the main page 100 is scrolling.

Referring now to FIGS. 5C, 5D and 5E, these figures represent the pages or part of pages 150a, 150b, 150c for navigating through the women's business apparel. The primary difference in these figures is that the pages are automatically scrolling thus the women's business apparel is "pushed" and presented to the user. The floating instruction box 110 remains essentially stationary. The user can select various elements in the displayed selection array to see additional information, or to buy something. The illustrations of FIGS. 5C, 5D and 5E illustrates that the website pages actively "push" the content to the viewer. In other words, the website actively navigates for the user and does not sit still waiting for the user's input before any navigation commences.

FIG. 5F illustrates the floating instruction box 110' when the help button 140 is clicked. The floating instruction box 110' includes a drop down dialog box 160 to explain the arrangement of the page.

FIGS. 5A-5F include a sub-window 170 that can be continuously scrolled automatically independently of the main window of the pages 100, 150a, 150b and 150c.

The present invention also provides a mechanism to make the otherwise passive browser/web media active and interactive, and TV/Video media interactive, enabling both media with pushing and pulling functions.

As can be appreciated, the present invention provides a method of automatically displaying and navigating through a media, whether TV/Video or Computer/Browser; and, automatically scrolling the content to push and allure navigation through the media.

The website exemplified in FIGS. 5A through 5F has multiple categories wherein each category has multiple sub-categories. The method provides for displaying a floating dynamic instruction box 110, 110' overlaid on the page that displays navigational links for alluring the user to further navigate to a category or to a sub-category.

The page 100 is a website home page. The page 100 includes at least one blinking picture or link. The method dynamically changes the floating dynamic instruction box 110, 110' in response the at least one blinking picture to entice the user to further navigate.

Accordingly, the method automates sequences of blinking links in a page; and activates the blinking links of the sequences to automatically and sequentially push navigation within the website. The sequences may be programmed based on a user's demographics or profile, or any other suitable criteria.

The pages 100, 150a, 150b and 150c include a sub-window 170. The sub-window 170 can be automatically scrolled independently of the main window of pages 100, 150a, 150b and 150c.

Numerous modifications to and alternative embodiments of the present invention will be apparent to those skilled in the

8

art in view of the foregoing description. Accordingly, this description is to be construed as illustrative only and is for the purpose of teaching those skilled in the art the best mode of carrying out the invention. Details of the structure may be varied substantially without departing from the spirit of the invention and the exclusive use of all modifications, which come within the scope of the appended claims, is reserved.

What is claimed is:

- 10 1. A method of displaying and navigating through a website, comprising:
displaying on a display of a computer a page of the website;
and during the displaying
operation and without any user-initiated actions, automatically scrolling at least part of the page while the user of the computer does nothing.
- 15 2. The method of claim 1, wherein the page includes at least two independent partitions.
- 20 3. The method of claim 2, wherein at least part of a respective partition of the at least two independent partitions is automatically scrolled.
- 25 4. The method of claim 2, wherein:
at least part of a first independent partition of the at least two independent partitions is automatically scrolled at a first speed; and
at least part of a second independent partition of the at least two independent partitions is automatically scrolled at a second speed.
- 30 5. The method of claim 4, wherein the second speed is different from the first speed.
- 35 6. The method of claim 4, wherein the second speed is the first speed.
7. The method of claim 2, wherein:
at least part of a first independent partition of the at least two independent partitions is scrolled in response to a user-initiated action; and
at least part of a second independent partition of the at least two independent partitions is automatically scrolled without any user-initiated actions.
- 30 8. The method of claim 7, wherein:
the automatic scrolling of the second independent partition of the at least two independent partitions is stopped in response to a user-initiated action.
9. The method of claim 1, further comprising:
in response to a user-initiated action, stopping the automatic scrolling of the page.
- 40 10. The method of claim 9, further comprising: in response to a user-initiated action, restarting the automatic scrolling.
- 50 11. An apparatus for displaying and navigating through a website, the apparatus comprising a computer configured to perform a method comprising:
displaying on a computer display a browser window having a field of view for displaying a page of the website within the field of view; and
during the displaying operation and without any user-initiated actions, automatically scrolling at least part of the page while the user of the computer does nothing.
- 55 12. The apparatus of claim 11, wherein the page includes at least two independent partitions.
- 60 13. The apparatus of claim 12, wherein at least part of a respective partition of the at least two independent partitions is automatically scrolled.
14. The apparatus of claim 12, wherein:
at least part of a first independent partition of the at least two independent partitions is automatically scrolled at a first speed; and

US 8,108,792 B2

9

at least part of a second independent partition of the at least two independent partitions is automatically scrolled at a second speed.

15. The apparatus of claim 14, wherein the second speed is different from the first speed.

16. The apparatus of claim 15, wherein the second speed is the first speed.

17. The apparatus of claim 11, wherein:

at least part of a first independent partition of the at least two independent partitions is scrolled in response to a user-initiated action; and

at least part of a second independent partition of the at least two independent partitions is automatically scrolled without any user-initiated actions.

5

18. The apparatus of claim 17, wherein:
the automatic scrolling of the second independent partition of the at least two independent partitions is stopped in response to a user-initiated action.

19. The apparatus of claim 11, further comprising:
in response to a user-initiated action, stopping the automatic scrolling of the page.

20. The apparatus of claim 19, further comprising:
in response to a user-initiated action, restarting the automatic scrolling.

ABSTRACT

An automatic scrolling mechanism converts an information repository into media that can actively present and “push” information to the users/viewers while retaining existing “pull” and interactivity functions. Automatic scrolling can be controlled by placing a cursor on control icons, such as boxes, lines, and arrow clusters. While the cursor is on an icon, automatic scrolling brings into view content that extends beyond the field of view. The scrolled content is moved into the field of view of the display window in a predetermined direction designated by the icon. Sub-windows are also designed to be independently and automatically scrolled or floated with respect the main window. Links created in an information repository may be automatically activated to retrieve the linked information, and to automatically present and scroll the information. As the content is automatically scrolled, the repository is pushed and the user is allured to further navigate through the repository.

The floating instructional box 110 further includes <P Pages N> for moving to previous or next pages when the <P or N> is clicked.

In the exemplary embodiment, if the user clicked on the graphical women icon 120a, FIGS. 5C, 5D and 5E may commence. The women icon 120a in the floating instructional box 110 is just a replicate of the women 120 in the page 100—representing women's business clothes. However, if the women 120 were dressed in ball gowns, prom or formal wear, it would be associated with the navigational link associated therewith. The "Steps" in the Categories section of the floating instruction box 10 allows the user to navigate to any sub category desired.

It should be noted the primary difference in FIGS. 5A and 5B is that the main page 100 is scrolling.

Referring now to FIGS. 5C, 5D and 5E, these figures represent the pages or part of pages 150a, 150b, 150c for navigating through the women's business apparel. The primary difference in these figures is that the pages are automatically scrolling thus the women's business apparel is "pushed" and presented to the user. The floating instruction box 110 remains essentially stationary. The user can select various elements in the displayed selection array to see additional information, or to buy something. The illustrations of FIGS. 5C, 5D and 5E illustrates that the website pages actively "push" the content to the viewer. In other words, the website actively navigates for the user and does not sit still waiting for the user's input before any navigation commences.

FIG. 5F illustrates the floating instruction box 110' when the help button 140 is clicked. The floating instruction box 110' includes a drop down dialog box 160 to explain the arrangement of the page.

FIGS. 5A-5F include a sub-window 170 that can be continuously scrolled automatically independently of the main window of the pages 100, 150a, 150b and 150c.

The present invention also provides a mechanism to make the otherwise passive browser/web media active and interactive, and TV/Video media interactive, enabling both media with pushing and pulling functions.

As can be appreciated, the present invention provides a method of automatically displaying and navigating through a media, whether TV/Video or Computer/Browser; and, automatically scrolling the content to push and allure navigation through the media.

The website exemplified in FIGS. 5A through 5F has multiple categories wherein each category has multiple sub-categories. The method provides for displaying a floating dynamic instruction box 110, 110' overlaid on the page that displays navigational links for alluring the user to further navigate to a category or to a sub-category.

The page 100 is a website home page. The page 100 includes at least one blinking picture or link. The method dynamically changes the floating dynamic instruction box 110, 110' in response to the at least one blinking picture to entice the user to further navigate.

Accordingly, the method automates sequences of blinking links in a page; and activates the blinking links of the sequences to automatically and sequentially push navigation within the website. The sequences may be programmed based on a user's demographics or profile, or any other suitable criteria.

The pages 100, 150a, 150b and 150c include a sub-window 170. The sub-window 170 can be automatically scrolled independently of the main window of pages 100, 150a, 150b and 150c.

Numerous modifications to and alternative embodiments of the present invention will be apparent to those skilled in the

8

art in view of the foregoing description. Accordingly, this description is to be construed as illustrative only and is for the purpose of teaching those skilled in the art the best mode of carrying out the invention. Details of the structure may be varied substantially without departing from the spirit of the invention and the exclusive use of all modifications, which come within the scope of the appended claims, is reserved.

What is claimed is:

1. A method for displaying content, the method being implemented on a computer and comprising:

- (a) identifying, in a content that is structured into a plurality of sets of which at least some sets are each programmed to display in a designated partition of a display area, at least a first set that contains more elements than a designated first partition for the first set can accommodate at one time;
- (b) while at least a portion of the content is displayed, automatically scrolling the first set in making visible each element of the first set in the designated first partition, so as to automatically make visible one or more elements of the first set that would otherwise not be visible in the designated first partition without the automatic scrolling, wherein the automatic scrolling is not in response to a user request for the automatic scrolling.

2. The method of claim 1, wherein (b) is performed in response to a user-input to initiate said automatically scrolling.

3. The method of claim 1, wherein (b) is performed in response to said at least the portion of the content being displayed.

4. The method of claim 1, wherein the designated first partition is provided as a column.

5. The method of claim 1, further comprising enabling a user to adjust a speed in which automatically scrolling is performed.

6. The method of claim 1, wherein the content is a web page.

7. The method of claim 1, wherein the content includes a second set, and wherein the method further comprises providing at least a portion of the second set for display in a second designated partition.

8. The method of claim 7, wherein the designated second partition is a column.

9. The method of claim 7, further comprising enabling a user to manually scroll the second set in order to make visible one or more elements of the second set, while performing (b).

10. The method of claim 7, further comprising automatically scrolling the second set in making visible each element of the second set in the designated second partition, while performing (b).

11. A system comprising:

a display screen; and
a computer processor configured to:
identify, in a content that is structured into a plurality of sets of which at least some sets are each programmed to display in a designated partition of a display area, at least a first set that contains more elements than a designated first partition for the first set can accommodate at one time;

while at least a portion of the content is displayed on the display screen, automatically scroll the first set in making visible each element of the first set in the designated first partition, so as to automatically make visible one or more elements of the first set that would otherwise not be visible in the designated first partition without the automatic scrolling, wherein the automatic scrolling is not in response to a user request for the automatic scrolling.

US 8,850,352 B2

9

10

12. The system of claim 11, wherein the computer automatically scrolls the first set in response to a user-input to initiate automatic scrolling.

13. The system of claim 11, wherein the computer automatically scrolls the first set in response to at least the portion 5 of the content being displayed on the display screen.

14. The system of claim 11, wherein the designated first partition is provided as a column.

15. The system of claim 11, wherein the computer is configured to enable a user to adjust a speed in which automatically scrolling is performed. 10

16. The system of claim 11, wherein the computer displays the content and enables automatic scrolling through a browser.

17. The system of claim 11, wherein the display screen is a 15 television.

The floating instructional box 110 further includes <P Pages N> for moving to previous or next pages when the <P or N> is clicked.

In the exemplary embodiment, if the user clicked on the graphical women icon 120a, FIGS. SC, SD and SE may commence. The women icon 120a in the floating instructional box 110 is just a replicate of the women 120 in the page 100—representing women's business clothes. However, if the women 120 were dressed in ball gowns, prom or formal wear, it would be associated with the navigational link associated therewith. The "Steps" in the Categories section of the floating instruction box 10 allows the user to navigate to any sub category desired.

It should be noted the primary difference in FIGS. 5A and 5B is that the main page 100 is scrolling.

Referring now to FIGS. 5C, 5D and 5E, these figures represent the pages or part of pages 150a, 150b, 150c for navigating through the women's business apparel. The primary difference in these figures is that the pages are automatically scrolling thus the women's business apparel is "pushed" and presented to the user. The floating instruction box 110 remains essentially stationary. The user can select various elements in the displayed selection array to see additional information, or to buy something. The illustrations of FIGS. 5C, 5D and 5E illustrates that the website pages actively "push" the content to the viewer. In other words, the website actively navigates for the user and does not sit still waiting for the user's input before any navigation commences.

FIG. 5F illustrates the floating instruction box 110' when the help button 140 is clicked. The floating instruction box 110' includes a drop down dialog box 160 to explain the arrangement of the page.

FIGS. 5A-5F include a sub-window 170 that can be continuously scrolled automatically independently of the main window of the pages 100, 150a, 150b and 150c.

The present invention also provides a mechanism to make the otherwise passive browser/web media active and interactive, and TV/Video media interactive, enabling both media with pushing and pulling functions.

As can be appreciated, the present invention provides a method of automatically displaying and navigating through a media, whether TV/Video or Computer/Browser; and, automatically scrolling the content to push and allure navigation through the media.

The website exemplified in FIGS. 5A through 5F has multiple categories wherein each category has multiple sub-categories. The method provides for displaying a floating dynamic instruction box 110, 110' overlaid on the page that displays navigational links for alluring the user to further navigate to a category or to a sub-category.

The page 100 is a website home page. The page 100 includes at least one blinking picture or link. The method dynamically changes the floating dynamic instruction box 110, 110' in response the at least one blinking picture to entice the user to further navigate.

Accordingly, the method automates sequences of blinking links in a page; and activates the blinking links of the sequences to automatically and sequentially push navigation within the website. The sequences may be programmed based on a user's demographics or profile, or any other suitable criteria.

The pages 100, 150a, 150b and 150c include a sub-window 170. The sub-window 170 can be automatically scrolled independently of the main window of pages 100, 150a, 150b and 150c.

Numerous modifications to and alternative embodiments of the present invention will be apparent to those skilled in the

8

art in view of the foregoing description. Accordingly, this description is to be construed as illustrative only and is for the purpose of teaching those skilled in the art the best mode of carrying out the invention. Details of the structure may be varied substantially without departing from the spirit of the invention and the exclusive use of all modifications, which come within the scope of the appended claims, is reserved.

The invention claimed is:

1. A computer implemented method for displaying and navigating a webpage, comprising:
displaying a webpage, wherein the webpage contains a designated area displaying a first set of content comprising a pictorial digital representation and wherein the first set of content is displayed in a stationary fashion for a period of time; and
automatically scrolling without any user-initiated actions the content within the designated area such that the first set of content is replaced by a second set of content comprising a pictorial digital representation, wherein the second set of content is displayed in a stationary fashion for a period of time.
2. The method of claim 1, wherein the designated area comprises a window.
3. The method of claim 2, wherein the window comprises one or more borders.
4. The method of claim 3, wherein the first and second sets of content are separated by at least one border that is also visible during the automatic scrolling operation.
5. The method of claim 1, further comprising pausing the automatic scrolling of a given set of content in response to a cursor being positioned within the designated area displaying said content.
6. The method of claim 1, further comprising pausing the automatic scrolling of a given set of content in response to a cursor being positioned on an object outside the designated area displaying said content.
7. The method of claim 1, further comprising pausing the automatic scrolling of a given set of content in response to a cursor being positioned on an object inside the designated area displaying said content.
8. The method of claim 6 or 7, wherein the pausing of the automatic scrolling is in response to the cursor being placed on the object, following by the receipt of a click operation.
9. The method of claim 1, further comprising, without any user-initiated actions, automatically scrolling the content within the designated area such that the second set of content is replaced by a third set of content comprising a digital representation of at least one object, wherein the third set of content is displayed in a stationary fashion for a period of time.
10. The method of claim 1, wherein the second and third sets of content are separated by at least one border that is visible during the automatic scrolling operation.
11. The method of claim 1 or 9, wherein at least one of the first, second and third sets of content displayed in the designated area contains a link to a webpage displaying information regarding the set of content in which the link is located.
12. The method of claim 1 or 9, wherein the selection of said link leads to a webpage that allows a user to purchase an item.
13. The method of claim 1, wherein at least one of the pictorial, digital representations is of an item available for commercial sale.
14. A computer implemented method for displaying and navigating a webpage, comprising:
displaying a webpage, wherein the webpage contains a designated area displaying a first set of content compris-

US 9,053,205 B2

9

ing a digital representation of at least one object and wherein the first set of content is displayed in a stationary fashion for a period of time and contains a link to a webpage displaying information about the at least one object digitally represented in the first set of content; and automatically scrolling without any user-initiated actions the content within the designated area such that the first set of content is replaced by a second set of content comprising a digital representation of at least one object, wherein the second set of content is displayed in a stationary fashion for a period of time and contains a link to a webpage displaying information about the at least one object digitally represented in the second set of content.

15. The method of claim 14, wherein the designated area comprises a window.

16. The method of claim 15, wherein the window comprises one or more borders.

17. The method of claim 14, further comprising pausing the automatic scrolling of a given set of content in response to a cursor being positioned within the designated area displaying said content.

18. The method of claim 14, further comprising pausing the automatic scrolling of a given set of content in response to a cursor being positioned on an object outside the designated area displaying said content.

19. The method of claim 14, further comprising pausing the automatic scrolling of a given set of content in response to a cursor being positioned on an object inside the designated area displaying said content.

20. The method of claim 18 or 19, wherein the pausing of the automatic scrolling is in response to the cursor being placed on the object, following by the receipt of a click operation.

21. The method of claim 14, wherein the first and second sets of content are separated by at least one border that is visible during the automatic scrolling operation.

22. The method of claim 14, further comprising, without any user-initiated actions, automatically scrolling the content within the designated area such that the second set of content is replaced by a third set of content comprising a digital representation of at least one object, wherein the third set of content is displayed in a stationary fashion for a period of time and contains a link to a webpage displaying information about the at least one object digitally represented in the third set of content.

23. The method of claim 14, further wherein the displayed first set of content comprises a digital representation of at least one object not displayed elsewhere on the webpage.

24. A computer implemented method for displaying and navigating a webpage, comprising:

displaying a webpage, wherein the webpage contains a designated area displaying a first set of content comprising a digital representation of at least one object not displayed elsewhere on the webpage and wherein the first set of content is displayed in a stationary fashion for a period of time and contains a link to a webpage displaying information about the at least one object digitally represented in the first set of content; and automatically scrolling without any user-initiated actions the content within the designated area such that the first set of content is replaced by a second set of content comprising a digital representation of at least one object,

10

wherein the second set of content is displayed in a stationary fashion for a period of time and contains a link to a webpage displaying information about the at least one object digitally represented in the second set of content.

25. The method of claim 24, wherein the designated area comprises a window.

26. The method of claim 25, wherein the window comprises one or more borders.

27. The method of claim 24, further comprising pausing the automatic scrolling of a given set of content in response to a cursor being positioned within the designated area displaying said content.

28. The method of claim 24, further comprising pausing the automatic scrolling of a given set of content in response to a cursor being positioned on an object outside the designated area displaying said content.

29. The method of claim 24, further comprising pausing the automatic scrolling of a given set of content in response to a cursor being positioned on an object inside the designated area displaying said content.

30. The method of claim 28 or 29, wherein the pausing of the automatic scrolling is in response to the cursor being placed on the object, following by the receipt of a click operation.

31. The method of claim 24, wherein the first and second sets of content are separated by at least one border that is visible during the automatic scrolling operation.

32. The method of claim 24, further comprising, without any user-initiated actions, automatically scrolling the content within the designated area such that the second set of content is replaced by a third set of content comprising a digital representation of at least one object, wherein the third set of content is displayed in a stationary fashion for a period of time and contains a link to a webpage displaying information about the at least one object digitally represented in the third set of content.

33. The method of claim 22 or 32, further wherein the displayed third set of content comprises a digital representation of at least one object not displayed elsewhere on the webpage.

34. The method of claim 9, 22 or 32, wherein the third set of content is displayed in a stationary fashion for a period of time that is the same as the period of time for which the first and second sets of content are displayed in a stationary fashion.

35. The method of claim 14 or 24, further wherein the displayed second set of content comprises a digital representation of at least one object not displayed elsewhere on the webpage.

36. The method of claim 14 or 24, wherein at least one of said objects is an item available for commercial sale.

37. The method of claim 1, 14 or 24, wherein the second set of content is displayed in a stationary fashion for a period of time that is the same as the period of time for which the first set of content is displayed in a stationary fashion.

38. The method of claim 1, 14 or 24, further comprising, without any user-initiated actions, automatically scrolling the content within the designated area such that the second set of content is replaced by an additional set of content, wherein the automatic scrolling of additional sets of content eventually results in the display of the first set of content.

(57) **ABSTRACT**

An automatic scrolling mechanism converts an information repository into media that can actively present and “push” information to the users/viewers while retaining existing “pull” and interactivity functions. Automatic scrolling can be controlled by placing a cursor on control icons, such as boxes, lines, and arrow clusters. While the cursor is on an icon, automatic scrolling brings into view content that extends beyond the field of view. The scrolled content is moved into the field of view of the display window in a predetermined direction designated by the icon. Sub-windows are also designed to be independently and automatically scrolled or floated with respect the main window. Links created in an information repository may be automatically activated to retrieve the linked information, and to automatically present and scroll the information. As the content is automatically scrolled, the repository is pushed and the user is allured to further navigate through the repository.

26 Claims, 17 Drawing Sheets

US 9,405,852 B2

9

7. The method of claim 1, wherein the automated state of moving of the set of content being displayed in the designated area is interrupted or changed in response to a user command; the method further comprising a user interaction mechanism set programmed for conveying at least one of the following user commands to the displaying of content sets in the display area:

pausing an ongoing automated moving of the displaying set of content,
resuming an automated changing of the displaying set of content after pausing,
changing the direction of automated scrolling when the changing is a visibly directional scrolling,
initiating an automated changing that is a visibly directional scrolling in a certain direction,
increasing the speed of the automated scrolling change, decreasing the speed of automated scrolling change, or initiating an automated scrolling change of the displaying set of content when the displaying is stationary.

8. The method of claim 7, wherein the user interaction mechanism set includes a set of actionable icons displaying in the designated display area, each icon symbolically signifying a command.

9. The method of claim 7, wherein the display device is a conductive touch sensitive display device, and the user interaction mechanism set further comprises in conjunction with the conductive touch device, receiving input via a finger or an electronic pen touching the conductive touch sensitive display device, in response to the received input, interpreting a specific user command, including at least one of the following commands:

initiate an automated visible scrolling change of displaying content in a certain direction,
changing the direction of the automated visible scrolling change,
increasing the speed of automated visible scrolling change, decreasing the speed of automated scrolling,
pausing the automated scrolling, or resuming the automated scrolling after pausing.

10. The method of claim 7, wherein the mechanism set further comprises, in response to a user activity, changes a displaying status, further comprising:

in response to the user activity received during a stationary period of the displaying a set of content, initiating the automated moving of the displaying set of content;
in response to the user activity received during an automated moving of the displaying a set of content, pausing the moving; and
in response to the user activity received during a pause, resuming the automated moving;
the set of actionable mechanisms are programmed to change an ongoing automated visible directional scrolling and at least one mechanism in the mechanism set that is present during a visible directional scrolling of the sets of content being displayed will result in one of the following change of displaying status:
stops scrolling,
initiate scrolling in the same direction,
speed up the scrolling in the same direction,
slow down scrolling in the same direction,
pausing scrolling, and
resume scrolling after pausing;
the displaying further comprising a directional mechanism opposite to a present scrolling direction will reverse the scrolling direction.

10

11. A system for interactively displaying digital content on an electronic display device, the system manipulating the digital content to display in a dynamic and user friendly manner, the system comprising at least one computing device comprising a non-transitory computer readable storage media further comprising executable instructions, further comprising:

at least one hardware processor coupled to the non-transitory computer readable storage media which executes the instructions and is configured to:
display a page of content on an interactive display screen of the device, wherein the page comprises a designated area for displaying one or more of a plurality of sets of content wherein the space required to display the plurality of sets of content collectively is larger than the space available in the designated area at a given point in time; display, in the designated area, a first set of content of the plurality of sets of content for a first period of time; and automatically moving, into the designated area and replacing the first set of content, a second set of content of the plurality of sets of content for a second period of time, thus continually and automatically progressing to display a next set of content of the plurality of sets of content by replacing the immediate preceding set of content currently displayed in the designated area; wherein each set of content comprises at least one actionable link linking to additional actionable content related to an object represented in the respective set of content currently being displayed in the designated area; and display, upon activation of the at least one of the actionable links, the additional content related to the object by the display device, separately from the displaying of the each set of content in the designated area.

12. The system of claim 11, wherein the moving of the set of content displaying in the designated area comprises a directional scrolling mechanism.

13. The system of claim 11, wherein each set of content displayed in the designated display area comprises a set of pictorially represented objects; at least one of the pictorial representations of the objects is associated with the actionable link linking to additional content including at least one of information or the actionable link concerning the represented object.

14. The system of claim 11, wherein the set of pictorially represented objects is a set of thumbnails of pictorial representations of objects.

15. The system of claim 13, wherein the additional content linked to a represented object in a displayed set of content comprises at least one actionable link for conducting an online activity related to the object.

16. The system of claim 15, wherein the online activity comprises an online commerce activity.

17. The system of claim 11, wherein the automated state of moving of the set of content being displayed in the designated area is interrupted or changed in response to a user command; the method further comprising a user interaction mechanism set programmed for conveying at least one of the following user commands to the displaying of content sets in the display area:

pausing an ongoing automated moving of the displaying set of content,
resuming an automated changing of the displaying set of content after pausing,
changing the direction of automated scrolling when the changing is a visibly directional scrolling,
initiating an automated changing that is a visibly directional scrolling in a certain direction,

60

US 9,405,852 B2

11

increasing the speed of the automated scrolling change, decreasing the speed of automated scrolling change, or initiating an automated scrolling change of the displaying set of content when the displaying is stationary.

18. The system of claim 17, wherein the user interaction mechanism set includes a set of actionable icons displaying in the designated display area, each icon symbolically signifying a command.

19. The system of claim 17, wherein the display device is a conductive touch sensitive display device, and

the user interaction mechanism set further comprises in conjunction with the conductive touch device, receiving input via a finger or an electronic pen touching the conductive touch sensitive display device, in response to the received input, interpreting a specific user command, including at least one of the following commands:

initiate an automated visible scrolling change of displaying content in a certain direction,
changing the direction of the automated visible scrolling change,
increasing the speed of automated visible scrolling change, decreasing the speed of automated scrolling, pausing the automated scrolling, or resuming the automated scrolling after pausing.

20. The system of claim 17, wherein the mechanism set further comprises, in response to a user activity, changes a displaying status, further comprising:

in response to the user activity received during a stationary period of the displaying a set of content, initiating the automated moving of the displaying set of content;
in response to the user activity received during an automated moving of the displaying a set of content, pausing the moving; and

in response to the user activity received during a pause, resuming the automated moving;

the set of actionable mechanisms are programmed to change an ongoing automated visible directional scrolling and at least one mechanism in the mechanism set that is present during a visible directional scrolling of the sets of content being displayed will result in one of the following change of displaying status:

stops scrolling,
initiate scrolling in the same direction,
speed up the scrolling in the same direction,
slow down scrolling in the same direction,
pausing scrolling, and
resume scrolling after pausing;
the displaying further comprising a directional mechanism opposite to a present scrolling direction will reverse the scrolling direction.

21. A method for displaying and instructing the browsing of and interacting with complex digital content on an electronic display, the method comprising:

automatically scrolling primary content on a primary display screen at a desired speed and direction; and

12

suspending a small boxed stationary display area over the scrolling primary content on the primary display screen; wherein the small boxed stationary display area displays relevant instructions for user action related to the primary content;

the automated scrolling further comprises, in response to a user interaction with the small boxed stationary display area:

suspending, re-initiating, or altering the speed of the automated scrolling.

22. The method of claim 21, wherein the user action instructions displayed in the small boxed display area further comprises a mechanism set for user interaction, comprising a mechanism for advancing a level of instruction, advancing a level of user action, repeating previous instructions, or page to next instructions.

23. The method of claim 21, wherein the primary content is an instructional manual, and the user action instructions displayed in the small box display area are practice actions for the user to make in relation with the displayed portions of the manual.

24. A system for displaying a complex user interactive content that instructs user to make a set of user actions relevant to the portion of primary content being displayed, the system comprising at least one computing device comprising a non-transitory computer readable storage media further comprising executable instructions, further comprising:

at least one hardware processor coupled to the non-transitory computer readable storage media which executes the instructions and implements:

automatically scrolling primary content on a primary display screen at a desired speed and direction; and suspending a small boxed stationary display area over the scrolling primary content on the primary display screen; wherein the small boxed stationary display area displays relevant instructions for user action related to the primary content;

the automated scrolling further comprises, in response to a user interaction with the small boxed stationary display area:

suspending, re-initiating, or altering the speed of the automated scrolling.

25. The system of claim 24, wherein the user action instructions displayed in the small boxed display area further comprises a mechanism set for user interaction, comprising a mechanism for advancing a level of instruction, advancing a level of user action, repeating previous instructions, or page to next instructions.

26. The system of claim 24, wherein the primary content is an instructional manual, and the user action instructions displayed in the small box display area are practice actions for the user to make in relation with the displayed portions of the manual.

(57) **ABSTRACT**

A method and system to program multiple sets of digital content to be displayed in time sequence in a designated display area in a webpage, and automatically changing the displaying content-set, cycling through the multiple sets of content in the designated display area without user initiated action for each change of the displaying content-set.

24 Claims, 17 Drawing Sheets

US 10,296,198 B2

7

woman 120, instructing or alluring the user to move the cursor onto the graphical women icon 120a and click. The automated feature of the link navigates the user to the women's business formal section.

The floating instruction box 110 contains instructions regarding what to do, and contains active links 131, 133, 135 and 137 to navigate to additional information. The help button 140 provides access to additional instructions. The feedback button allows the user to provide feedback. The "floating" feature of the floating instruction box 110 allows such box to be within view so that it can be accessed anytime as the main pages 100 are scrolled. It can also be "double clicked" out of view, or "double clicked" back into view, or controlled by any desirable control symbol or convention, such as the standard "-" window-minimizing icon in Microsoft applications. As the user interacts with the instructions in the floating instruction box 110, a new page is displayed (navigated to) and new instructions relevant to such new page appear in the floating instruction box 110, so that the user does not have to go elsewhere to look for help/guide/instruction material.

All of the educational or help/guide/instructional material has instructions at a certain place on a page, or even previous pages. Therefore, when the user wants to look at it again, the user can scroll or page back to where the instruction was—if it is remembered where it was seen, and lose the place where you are actually working on, and needing those instructions that was way back where you don't remember.

The floating instructional box 110 further includes <P Pages N> for moving to previous or next pages when the <P or N> is clicked.

In the exemplary embodiment, if the user clicked on the graphical women icon 120a, FIGS. 5C, 5D and 5E may commence. The women icon 120a in the floating instructional box 110 is just a replicate of the women 120 in the page 100—representing women's business clothes. However, if the women 120 were dressed in ball gowns, prom or formal wear, it would be associated with the navigational link associated therewith. The "Steps" in the Categories section of the floating instruction box 10 allows the user to navigate to any sub category desired.

It should be noted the primary difference in FIGS. 5A and 5B is that the main page 100 is scrolling.

Referring now to FIGS. 5C, 5D and 5E, these figures represent the pages or part of pages 150a, 150b, 150c for navigating through the women's business apparel. The primary difference in these figures is that the pages are automatically scrolling thus the women's business apparel is "pushed" and presented to the user. The floating instruction box 110 remains essentially stationary. The user can select various elements in the displayed selection array to see additional information, or to buy something. The illustrations of FIGS. 5C, 5D and 5E illustrates that the website pages actively "push" the content to the viewer. In other words, the website actively navigates for the user and does not sit still waiting for the user's input before any navigation commences.

FIG. 5F illustrates the floating instruction box 110' when the help button 140 is clicked. The floating instruction box 110' includes a drop down dialog box 160 to explain the arrangement of the page.

FIGS. 5A-5F include a sub-window 170 that can be continuously scrolled automatically independently of the main window of the pages 100, 150a, 150b and 150c.

The present invention also provides a mechanism to make the otherwise passive browser/web media active and inter-

8

active, and TV/Video media interactive, enabling both media with pushing and pulling functions.

As can be appreciated, the present invention provides a method of automatically displaying and navigating through a media, whether TV/Video or Computer/Browser; and, automatically scrolling the content to push and allure navigation through the media.

The website exemplified in FIGS. 5A through 5F has multiple categories wherein each category has multiple sub-categories. The method provides for displaying a floating dynamic instruction box 110, 110' overlaid on the page that displays navigational links for alluring the user to further navigate to a category or to a sub-category.

The page 100 is a website home page. The page 100 includes at least one blinking picture or link. The method dynamically changes the floating dynamic instruction box 110, 110' in response to the at least one blinking picture to entice the user to further navigate.

Accordingly, the method automates sequences of blinking links in a page; and activates the blinking links of the sequences to automatically and sequentially push navigation within the website. The sequences may be programmed based on a user's demographics or profile, or any other suitable criteria.

The pages 100, 150a, 150b and 150c include a sub-window 170. The sub-window 170 can be automatically scrolled independently of the main window of pages 100, 150a, 150b and 150c.

Numerous modifications to and alternative embodiments of the present invention will be apparent to those skilled in the art in view of the foregoing description. Accordingly, this description is to be construed as illustrative only and is for the purpose of teaching those skilled in the art the best mode of carrying out the invention. Details of the structure may be varied substantially without departing from the spirit of the invention and the exclusive use of all modifications, which come within the scope of the appended claims, is reserved.

The invention claimed is:

1. A method of programming a webpage of a website to time-share at least one designated displaying area of a part of the webpage to display a plurality of sets of content one set of content at a time, each for a pre-designated time interval when the webpage is accessed by a user through entering a uniform resource locator (URL) of the webpage into a web-browser on an interactive display screen of an electronic display device, the method comprising:

designating and defining the at least one designated displaying area in a user desired displaying area on a desired part of the webpage for displaying a plurality of sets of content;

designing a plurality of sets of content that a website owner most want users of the website to see on this part of the webpage, and program the plurality of sets of content to be displayed in the designated displaying area of the webpage and store them in the database of the webpage;

designating a time interval for displaying each set of the plurality of sets of content;

programming the displaying of the webpage to automatically display the plurality of sets of content one at a time in the designated displaying area of the webpage when the URL is entered into the web-browser by the user, each set of content displaying for a pre-designated time interval for the set of content, including:

after a first set of content of the plurality of sets of content displaying for a first interval of time, automatically removing the first set of content from the

US 10,296,198 B2

9

designated displaying area, and moving into the designated displaying area a second set of content of the plurality of sets of content for a second interval of time, the second set of content replacing the first set of content so that there is continual and automatic progressing to display a next set of content of the plurality of sets of content by replacing an immediately preceding set of content displayed in the designated displaying area, and continually looping through the plurality of sets of content when no user command is issued for a change, automated looping requiring no user action, except for when an initiation action to commence automated looping is desired; and

programming a user-website interaction mechanism used with the designated displaying area of the webpage for the user to receive instructions from the website and for the website to receive a user command.

2. The method according to claim 1, wherein a content set in the plurality of content sets includes an image.

3. The method according to claim 1, wherein a content set in the plurality of content sets includes a video clip.

4. The method according to claim 1, wherein a content set in the plurality of content sets includes an animated image with a portion of the animated image changing in time.

5. The method according to claim 1, wherein a content set in the plurality of content sets is embedded with a link, linking to information related to the content set.

6. The method according to claim 1, wherein a mechanism of changing from displaying one content set to a next content set is a visible scrolling movement of a displaying content set.

7. The method according to claim 1, wherein a mechanism of changing from displaying one content set to a next content set appears to be a sudden change to human eye, in a fashion of an un-animated slide show.

8. The method according to claim 1, wherein a mechanism of changing from displaying one content set to a next content set is an animated change that takes place in a time-duration discernable to human eye, in a fashion of an animated slide-show.

9. The method according to claim 1, wherein a set of floating directional indicators is displayed overlapping a displaying content set to allow a viewer to access a previously displayed content set, or to skip to a next content set in a lineup of the plurality of content sets.

10. The method according to claim 1, wherein a set of floating non-directional indicators is displayed overlapping a part of a displaying content set, while indicating which of the plurality of content sets is presently displaying in the designated display area and allowing a user to command the displaying of any set in the plurality of content sets programmed to be displayed in the designated display area.

11. The method according to claim 1, wherein a content set in the plurality of content sets is designed to represent a theme story, a news story, a line of products or services, or a product or service.

12. A method as in claim 1:

wherein at least one set of content in the plurality of sets of content is embedded with at least one actionable link linking to additional content related to an object represented in the respective set of content to be displayed in the designated area; and

wherein, upon activation of the at least one of the actionable links by a user indicating interest, the additional content linked by the activated link is displayed on the display device for the user.

10

13. A system comprising a plurality of networked computers and electronic display devices loaded with software programs including website hosting utilities, databases, web-browser software and webpage programming and displaying software linking to the web-browser and the electronic display devices; the system further comprising:

a webpage of a website programmed to time-share a designated displaying area in a part of the webpage to display a plurality of sets of content one set of content at a time, each for a pre-designated time interval when the webpage is accessed by a user through entering a uniform resource locator (URL) of the webpage into a web-browser on an interactive display screen of an electronic display device, the system enables:

the designation and defining of a displaying area on a part of the webpage for displaying

a plurality of sets of important content that a website owner most wants users of the website to see in this designated display area,

designing the plurality of sets of content to store in a easily updatable fashion in the database for the webpage and designating a desired time interval to display each set of the plurality of the content set and store the time intervals in an easily updatable fashion in the database of the webpage,

displaying the plurality of sets of content in the designated displaying area of the webpage displaying in a web-browser each for a designated time interval when a user enters the URL of the webpage into the web-browser on the electronic display device;

the web-browser displaying the webpage on the electronic device automatically displays the plurality of sets of content one at a time in the designated displaying area of the webpage when the URL is entered into the web-browser by the user, each set of content displaying for a pre-designated time interval for the set of content, including:

after a first set of content of the plurality of sets of content displaying for a first interval of time, automatically removing the first set of content from the designated displaying area, and moving into the designated displaying area a second set of content of the plurality of sets of content for a second interval of time, the second set of content replacing the first set of content so that there is continual and automatic progressing to display a next set of content of the plurality of sets of content by replacing an immediately preceding set of content displayed in the displaying area, and continually looping through the plurality of sets of content when no user command is issued for a change, automated looping requiring no user action, except for when desired an initiation action to commence automated looping; and

a mechanism allowing user-website interaction used with the designated displaying area of the webpage for the user to receive instructions from the website and the website to receive a user command.

14. The system according to claim 13, wherein a set of floating non-directional indicators is displayed overlapping a displaying content set, while indicating which of the plurality of content sets is presently displaying in the designated display area and allowing a user to command display of any set in the plurality of content sets programmed to be displayed in the designated display area.

US 10,296,198 B2

11

15. The system according to claim 13, wherein a content set in the plurality of content sets is designed to represent a theme story, a news story, a line of products or services, or a product or service.

16. The system according to claim 13, wherein a content set in the plurality of content sets includes an image.

17. The system according to claim 13, wherein a content set in the plurality of content sets includes a video clip.

18. The system according to claim 13, wherein a content set in the plurality of content sets includes an animated image with a portion of the image changing in time.

19. The system according to claim 13, wherein a content set in the plurality of content sets is embedded with a link, linking to information related to the content set, when the link is activated by a user, the information is brought forth to display on the electronic display device for the user.

20. The system according to claim 13, wherein a mechanism of changing from displaying one content set to a next content set is a visible scrolling movement of a displaying content set.

12

21. The system according to claim 13, wherein a mechanism of changing from displaying one content set to a next content set appears to be a sudden change to human eye, in a fashion of an un-animated slide show.

5 22. The system according to claim 13, wherein a mechanism of changing from displaying one content set to a next content set is an animated change that takes place in a time-duration discernable to human eye, in a fashion of an animated slide-show.

10 23. The system according to claim 13, wherein a set of floating directional indicators is displayed overlapping a displaying content set to allow a viewer to access a previously displayed content set, or to skip to a next content set in a lineup of the plurality of content sets.

15 24. The system according to claim 13, wherein a content set in the plurality of content sets is embedded with a link, linking to information related to the content set.
